Sequence 11, Application US/09812913

GENERAL INFORMATION:
APPLICANT: Weeks, Donald
APPLICANT: Cerutti, Heriberto
TITLE OF INVENTION: Acetolactate synthase gene and construct for the transformatio
TITLE OF INVENTION: Extranuclear genomes
FILE REPERENCE: N1231-210
CURRENT FILING DATE: 2001-03-20
FRIOR PPLICATION NUMBER: 60/190,668
PRIOR FILING DATE: 2000-03-20
NUMBER OF SEQ ID NOS: 26
SEQ ID NO 11
LENGTH: 30

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 57,

                                 The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. The present invention describes a number of phosphorothicate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PEBP2 alpha A gene expression regulating DNA PCR primer SEQ ID NO:26.
                                                                                                                                                                                             in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                   ö

A new method for developing vaccines has been identified, in which a non-naturally occurring molecular scaffold, having a core particle and a covalently attached organiser, is attached to an antigen or antigenic determinant. The scaffold and antigen or antigenic determinant interact to form an ordered and repetitive antigen array. The composition is useful as a vaccine against infectious diseases, to induce immune responses in farm animals and also in the treatment of cancer and allergies. The present sequence is the PCR primer, 9p140CysEcoRI. This primer was used to amplify the coding sequence for the gp140 gene of human immunodeficiency virus (HIV). The PCR product was then used as an antigen in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                     Composition for use as vaccine against infectious diseases and in treatment of cancer and allergies comprises non-naturally occurring molecular scaffold and antigen or antigenic determinant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antigen presentation; vaccine; infectious disease; allergy; cancer; molecular scaffold; immune response; farm animal; organiser; gpl40; immunostimulatory; cytostatic; antiallergy; human immunodeficiency virus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes DNA which participates in the regulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of expression of PEBP2 alpha A gene. The DNA produces a regulator protein with the activity of promoting bone formation and can serve as promoter for prevention and treatment of bone diseases including osteoporosis. The present sequence represents a PCR primer used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                     DNA regulating expression of PEBP2 alphaA gene to produce regulator protein, useful as promoter for prevention or/and treatment of bone diseases e.g. osteoporosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```
of ligands to thrombin. These sequences were isolated using the single stranded DNA molecules given in AATO0201 and AATO0226 which comprise a 30N and a 60N variable region, respectively. These ligands were isolated using systematic evolution of ligands by exponential enrichment (SELEX). The selection was conducted in a buffer solution at 37 deg. C. After 12 rounds of selection, no additional improvement in binding was seen. By studying regions of homology between the isolated ligands, a truncated ligand of 38 nucleotides (see AAQ98403-04) was identified which inhibitors of thrombin and are therefore useful in treating thrombin mediated conditions and in studying the structure and binding of
                                                                                                                                                                                                                                                                             ;

The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic flibroblast growth factor (bFGF). The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including intitation and progression of atherosclerosis, acute coronary syndromes, vein graft disease and restenosis following coronary angloplasty. The ligands have improved stability in vivo.

```
sample which uses a calibrator, suitable primers and probes, and sample which uses a calibrator, suitable primers and probes, and a nucleic acid polymerase with 5'-3' nuclease activity is described. The method comprises adding a calibrator nucleotide to the sample, the calibrator nucleotide having the same sequence as the target with the exception of one or more regions which in the target hybridize with the probe labeled with a reporter and quencher, or which hybridize with the probe and with 2 or more primers. These regions have a different, randomized nucleotide sequence and a similar Im. Then extracting the calibrator and target nucleotides from the sample. Probes and primers are then added to the extracted sample/calibrator mixture and PCR is performed. Reaction in the presence of the target nucleic acid specific probe permits quantitation of the copy number of the calibrator nucleotide permits quantitation of the calibrator copy the total number of target templates and calibrator copy the total number of target templates and calibrator and submits and primers are the parallely may be mathed may the post of the calibrator of the calibrator copy and the coll number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    calculation of the percentage of calibrator recovery. The method may be used for the diagnosis of viral and any other pathogenic agents in body fluids, and to monitor safety and/or genetic composition of waters, foods, and plant species used in the alimentary field. The method is used to quantitatively detect the genomic nucleic acid of human herpes virus (HHV)-6, HHV-7, HHV-8 and human immunodeficiency

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a nucleic acid segment of 10-100

Contiguous bases chosen from one of 632 fragments (AAA78631 to
AAA7952), where the segment comprises a polymorphic site or an
immediately adjacent base, or the complement of the segment. Also
described are: (1) an allele-specific oligonucleotide that hybridises to
a segment of the novelty; (2) an isolated nucleic acid comprising a
segment of the novelty where the polymorphic site within the sequence is
ccupied by a base other than the reference base indicated in the
specification; and (3) analysing a nucleic acid, comprising obtaining a
nucleic acid from an individual, and determining a base occupying any one
of the polymorphic sites of the novelty. The nucleic acid segments and
method can be used to analyse an individuals nucleic acid segments and
the presence of polymorphisms. The method can also be used to test for a
artian and an and correlate the presence of the phenotype with a
artians and an articulate the presence of the phenotype with a
                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human genomic polymorphic nucleic acid segments, allele specific primers and probes, and methods of analysis, useful for e.g. forensics, paternity testing, genetic mapping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        particular polymorphism. The presence of polymorphic sites are useful
                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for, e.g. forensics, paternity testing, correlation of polymorphisms with phenotypic traits and for genetic mapping of phenotypic traits.

AAA78631 to AAA79262 represent sequence tags of human genomic DNA fragments containing polymorphic sites. The base occupying the polymorphic sites. The base occupying the
                                                                                                                                                                                                                                                                                                                                                                                                   Human; genomic DNA; polymorphism; genome; allele-specific; primer;

This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a number of phosphorothicate antisense

The present sequence represents a fragment from a clone of a method for including the 3'-untranslated region of a DNA molecule comprising an open reading frame (ORF). The method comprises providing a DNA molecule having an ORF and a 3'-untranslated region, the DNA having a 5' overhang and a blunt end at the 3' end, and treating the DNA molecule with a 3'-5' exonuclease followed by a single-stranded nuclease to remove the 3'-untranslated region. The products can be used to produce RNA-protein fusion libraries. The fusion libraries can be used for the identification of protein-protein interactions, identification of drug targets, and hybridisation to solid supports to erreate protein of protein molecules may be arranged in spatially defined arrays on the protein chips to carry out large scale screening for protein or compound identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Producing nucleic acids lacking 3'-untranslated regions to optimise production of fusion proteins, used to produce fusion libraries for identification of protein:protein interactions and drug targets for the production of protein chips:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a fragment from a clone of a mak-protein fusion library comprising KIAA0111. specification describes a method for removing the 3'-untranslated region of a DNA molecule comprising an open reading frame (ORF). The method comprises providing a DNA molecule having an ORF and a 3'-untranslated region, the DNA having a 5' overhang and a blunt end at the 3' end, and treating the DNA molecule with a 3'-5' exonuclease followed by a single-stranded nuclease to remove the 3'-untranslated region. The products can be used for the identification of protein protein interactions, identification of drug targets, and hybridisation to solid supports to create protein chips (or beads). The RNA-protein molecules may be arranged in spatially defined arrays on the protein chips to carry out
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing nucleic acids lacking 3'-untranslated regions to optimise production of fusion proteins, used to produce fusion libraries for identification of protein:protein interactions and drug targets for the production of protein chips
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                 a "an unspecified number of bases are present between these nucleotides"
                                                                                                                         Nucleotide sequence of a clone from a RNA-protein fusion library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention relates to the use of apoptotic genes in the the production of transgenic plants with improved resistance characteristics. The present sequence is the mutagenic PCR primer Bcl2-3. This primer was used with primer Bcl2-5 (AAA48984) to introduce a 5' Ncol site and a 3' Xbal site in the human apoptotic gene bcl-2. Specifically the primer introduced an Ala residue between the Met (position 1) and His (position 2) residues of the native protein. The altered bcl-2 sequence was used in the creation of the final vector used to transform plants. The improved resistance characteristics of the plants helps protect against bacterial, viral and other pathogens. Resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-terminal transport polypeptide; insect pest control; cell cycle; Autographa californica multinucleocapsid nuclear polyhedrosis virus; ACMNPV; occlusion derived virus; ODV; 66 kD envelope protein; ODV-866; membrane protein; intranuclear viral-induced microvesicle; GFP; URF-13; beta-galactosidase; b-gal; green fluorescent protein; marker; primer; polymerase chain reaction; PCR; amplify; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The 5' nucleotide of the primer corresponds to nucleotide 21394 of the complementary strand of the maize plastid genome sequence. The primer was designed to add a Xhol restriction site downstream of an amplified rpoB fragment following PCR amplification. The PCR product was cloned into vector pBSKS+ and used to generate protecting RNA for use in in vitro capping experiments. The invention provides isolated rpoB, atpB, clpP and 16S rDNA NEP and exogenous producing of interest in plant plastids.
                                                                                                                                                                                                                                                                                                                                                                                    Isolated nuclear-encoded plastid RNA polymerase promoter sequences useful for expressing exogenous protein in plant plastids such as chloroplasts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutagenic PCR primer Bcl2-3 targeted to anti-apoptotic gene bcl-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the nucleotide sequence of maize rpoB gene primer rpoB#3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The sequences given in AAT59548-49 are primers which were used to amplify the sequence encoding residues 1-23 of Autographa californica multi- nucleacopsis on unclear polyhedrosis virus (AcMNPV) occlusion derived virus (ODV) 66 kD envelope protein (ODV-E66). ODV-E66 is an integral membrane protein of the ODV envelope. In an infected cell outlets, ODV-E66 is present in the intranuclear viral-induced microvesicles and ODV envelope, providing evidence that the microvesicles microvesicles on immediate precursor in the assembly of the ODV envelope. In infected cells, ODV-E66 localises to the ODV envelope. The ampranes of function as an immediate precursor in the assembly of the ODV envelope. CC in infected cells, ODV-E66 localises to the ODV envelope. The amplified microvesicles, membranes of the nuclear envelope. The amplified sequence encodes the N-terminal, target sequence domain of ODV-E66. The target sequence may be used to target beta-galactosidase (b-gal), green carget sequence may be used to target beta-galactosidase (b-gal), green cluorescent protein (GFP) and URF-13 to the membranes of the nuclear correlan proteins to the ODV envelope and intranuclear microvesicles. It can be used for insect pest control, for therapeutic applications, e.g. correlan proteins to the ODV envelope and intranuclear microvesicles. CC foreign proteins to the ODV envelope and intranuclear microvesicles. CC for location of a protein, peptide or derivative into the nuclear correlan marker specific for a disease or abnormality into a cell tissue correct control correct manifesting such abnormalities.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                      The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      calibrator, suitable primers and probes, and a nucleic acid polymerase with 5'-3' nuclease activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sample which uses a calibrator, suitable primers and probes, and a nucleic acid polymerase with 5-3' nuclease activity is described. The method comprises adding a calibrator nucleotide to the sample, the calibrator nucleotide having the same sequence as the target with the cabibrator nucleotide having the same sequence as the target with a probe labeled with a reporter and quencher, or which hybridize with a probe labeled with a reporter and quencher, or which hybridize with the probe and with 2 or more primers. These regions have a different, randomized nucleotide sequence and a similar Tm. Then extracting the calibrator and target nucleotides from the sample. Probes and primers are then added to the extracted sample/calibrator
                                                                                              in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection; identification; PCR; polymerase chain reaction; probe; primer; calibrator; diagnosis; pathogen; virus; bacteria; HHV-6; HHV-7; HHV-8; human herpes virus; human immunodeficiency virus; HIV; AIDS; acquired immune deficiency syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                  calculation of the percentage of calibrator recovery. The method may be used for the diagnosis of viral and any other pathogenic agents in body fluids, and to monitor safety and/or genetic composition of waters, foods, and plant species used in the alimentary field. The method is used to quantitatively detect the genomic nucleic acid of human herpes virus (HHV)-6, HHV-7, HHV-8 and human immunodeficiency virus (HIV). The method provides an enhanced sensitivity, accuracy, and precision and a reduced measure viability. For specific probe, primer and calibrator sequences used in the method, see GENESEQ records AAL393935-293965.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
of the extracted target nucleic acid. The reaction in the presence of the calibrator nucleotide permits quantitation of the calibrator columber. The reaction in the presence of both permits calculation of the total number of target templates and calibrator, allowing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; focal adhesion kinase; FAK; signal transduction; cancer; embryonic development disorder; angiogenic disorder; wound healing;

The sequences given in AAQ50202-70 are oligonucleotides which were used to illustrate the method of the invention for the mutagenesis of inhibitory/instability signals (INS). Mutation in an INS produced using oligonucelotides such as these, increases the stability and/or utilisation of mRNA without changing its protech coding capacity, or if the sequence is changed, its function is maintained. Other genes encoding such mRNA molecules include growth factor, interferon,

Nucleic acid constructs in which INS function has been impeded, can be used as vaccines, esp. against AIDS and AIDS-related diseases by preventing HIV from establishing a latent infection, as is possible using the INS, and thus escaping immune system surveillance. The constructs may also be used in gene therapy for each explacement by homologous recombination with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Receptor tyrosine kinase; vascular endothelial cell growth factors;

                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                   This PCR primer is designed from a region of the kinase domain 5' to the kinase insert domain of a consensus sequence of known type III str gene catalytic domains. It is used with AAQ28273 to amplify human endothelial cDNA producting 251 and 420 bp products. Sequencing of the 251bp product revealed a novel sequence containing both primers but with little homology to known tyrosine kinases.

This oligonucleotide Fas1 is used for the generation of a Fas signal sequence for post translational modification of a novel human Fas ligand (hFasL) fusion protein. This novel protein comprises of hFasL or a truncated or functionally equivalent variant that retains the Fas truncated to Incorporate inducing properties of hFasL. This is liked to Glycoxyl-Phosphatidyl inositol (GFI) at its C-terminus. DNA encoding hFasL amino acids, a linker sequence and a human Fas signal sequence derived from human CDIG. The fusion protein can be produced by culturing COS cells transformed by the expression vector product. This novel fusion protein can incorporate its lipid tail can be produced. This novel fusion protein can incorporate its lipid tail can be produced. This novel fusion protein can incorporate its lipid tail can coll membranes, and thus present the FasL protein on the cell surface. This can bind to Fas receptor present on other cells, particularly T lymphocytes, and thereby induce their apoptosis. This is useful for preventing or treating tissue or organ allograft or xenograft rejection. This provides a specific treatment for activated T lymphocytes, i.e. only for T lymphocytes that expresses the Fas antigen, which attack the transplanted tissue or organ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1-2-rhamnosyl-transferase; hesperidin conversion; orange peel; NHDC; flavone-7-0-glucosidase-2"-0-rhamnosyl-transferase; flavanoid glycoside; sweetener; neohesperidin dlhydrochalcone; grapefruit; pomelo;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting polymorphism associated with cancer pre:disposition - also DNA, vectors and host cells e.g. for gene or protein replacement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTSIElbeta gene ORF (amplified using the PCR primers AAT00719-21). The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Multiple tumour suppressor; MTS1Elbeta; cancer; diagnosis; assay;
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multiple tumour suppressor 1 exon 1 beta gene PCR reverse primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The cDNA sequences encoding several multiple tumour suppressor (MTS) polypeptides have been isolated and sequenced, using various sequencing and amplification primers such as the primer represented in this sequence. MTS polypeptide-encoding cDNAs and mutants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS cDNAs can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyrold, ovary, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg. an altered MTS gene are useful for screening for potential cancer therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Wild-type multiple tumour suppressor (MTS) gene and mutant sequences - useful in diagnosis, prognosis and therapy of human cancer, e.g. melanoma or leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Primers AAV11267-V11269 are used in the isolation of the human multiple tumour suppression protein, MTS1E1-beta. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9921. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; multiple tumour suppressor 1 gene; MTS1; cancer; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of a PCR primer used for amplification in the method of the invention involving the use of the multiple tumour suppressor (MTS) gene, to diagnose and treat cancer. The WTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cencer therapy, and the protein itself may also be used to restore MTS function in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

PCR primers AAV70612-14 were used to amplify nucleic acid encoding a human multiple tumour suppressor 1E1-beta (MTS1E1-beta) protein. Primers designed from the gene can be used to design primers to detect annormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.
                       Example 11; Column 48; 80pp; English.

                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes new purified and isolated nucleic acids (i) encoding: (i) the A and B chains of a ricin-like toxin (II); and (ii) a heterologous linker, joining the two chains and including a cleavage recognition site for a disease-specific protease (III). Also described are: (I) plasmids or baculovirus transfer vectors that contain (I); and (2) recombinant protein (IV) consisting of the A and B chains of (III) joined by the specified linker. (IV), produced by expression of (I) in host cells, are used to inhibit or kill diseased cells that produce (III), particularly for treating cancers (e.g. leucocyte prodliferation; cancer of ovary, pancreas, breast or prostate; glioma) or infections caused by fungi, parasites (e.g. malaria) or viruses (e.g.
                     The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
                                                          in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding ricin-like toxin with an interchain linker

cytomegalovirus (CMV), herpes, hepatitis, rhinovirus, laryngeotracheitis, poliomyelitis or varicella zoster), also cystic fibrosis and multiple sclerosis. Alternatively, (I) is used to express (IV) in vivo. (IV) is toxic specifically for (III)-expressing cells and does not depend for specificity on a cell-binding component. When used to treat virus-retrograde cells, transcytosis and cytotoxicity of (IV) are increased by retrograde translocation from endoplasmic reticulum to cytoplasm (which some viruses exploit to avoid immune detection), so selectivity and safety are further improved. (IV) are not toxic until chain A is released and this occurs only in target cells. The present sequence represents a nucleotide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; focal adhesion kinase; FAK; signal transduction; cancer; embryonic development disorder; angiogenic disorder; wound healing; antisense; phosphorothioate; ss.

Enhanced LM609 grafted antibodies exhibiting selective binding affinity to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of angiogenesis, inflammatory diseases e.g. psoriasis, cancers and osteoporosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to enhanced LM609 grafted antibodies exhibiting selective binding affinity to aphabveta_3 integrin or their functional fragments. The antibodies or their functional fragments can be used in the diagnosis and treatment of aphabveta_3-mediated diseases such as anglogenessis, inflammatory diseases (such as psociasis and chronic articular rheumatism), disorders associated with inappropriate or inopportune invasion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequencing; target specificity; PCR; amplification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antibody LM609 heavy and light chain variable region. LM609 and the antibody LM609 heavy and light chain variable region. LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psorlasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of LM609 have affinity more than 90 times
                                                                                                                                                                                                                                                                                                                            Vitaxin; antibody; variable region; heavy chain; light chain; integrin; LM609; inhibitor; integrin-mediated signal transduction; treatment; diagnosis; angiogenesis; restenosis; inflammation; diabetic retinopathy; neovascular glaucoma; cancer; psoriasis; rheumatoid arthritis; murine; macular degeneration; osteoporosis; primer; V-L region; CDR; complementarity determining region; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension of hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other disease e.g. agammaglobulinemia, diabetes inspidus, Lesch-Nyhan syndrome, muscullar dystrophy, wiskort. Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary hemorrhagica telangiectasia, familial colonic polyposis, Ehers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals.
                                                                                                                                                                                                                                                              Novel nucleic acids containing polymorphisms used in the diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Marek's disease virus; MDV; vaccine; antisense; therapy; latency; tumor; primer; polymerase chain reaction; PCR; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The target nucleotide sequence was used to demonstrate a method for improving the priming specificity of a non-unique oligonucleotide primer. Preferably the oligonucleotide primer is modified by a radioactive element, a fluorescent moiety or a biotin moiety. The methods are used particularly for the sequencing of target DNA sequences. The methods using the priming specificity of a non-unique oligonucleotide primer by using differential extension of the primer with nucleotide primer by length discrimination against shorter extensions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphism; hypertension; agammaglobulinemia; diabetes insipidus; Lesch-Nyhan syndrome; muscular dystrophy; Wiskott-Aldrich syndrome; Fabrys disease; familial hypercholesterolemia; hereditary spherocytosis; polycystic kidney disease; von Willebrands disease; forensic; human; tuberous sclerosis; hereditary hemorrhagica telangiectasia; familial colonic polyposis; osteogenesis imperfecta; porphyria;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a mammalian PGI gene and protein, and a set of PGI biallelic markers. The PGI polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PGI-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Barly-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant
                                                                                                                                                                                                                                                                                                                                                                                               gene; biallelic marker; PCR primer; PG1-related biallelic marker;

The present invention describes an isolated nucleotide sequence (I)
encoding at least a portion of the human alpha-7 neuronal nicotinic
acetylcholine receptor (alpha7-hnAchR). Also described are: (1) a
peptide encoded by (I): (2) a vector comprising (I): (3) a host cell
transformed with a vector of (2): (4) a polynucleotide comprising at
least 15 nucleotides which hybridises under stringent conditions to at
least a portion of (I): (5) a method for detection of a polynucleotide
encoding alpha 7-hnAchR in a biological sample; and (6) a method for
amplification of nucleic acid from a sample suspected of containing
nucleic acid encoding alpha 7-hnAchR. The primers and probes from the
present invention can be used on brain tissue and blood samples of
humans suspected of suffering from schizophrenia, small cell lung
carcinoma, breast cancer and nicotine-dependent illness. This is
particularly useful for diagnosis of schizophrenia. Other illnesses
that can be studied/diagnosed are epilepsy (e.g. juvenile myoclonic
epilepsy) and Prader-Willi and Angelman's syndromes.
affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; alpha-7 nicotinic receptor; neuronal; hybridisation; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ORFs) of the genome of Childran trachomatis (see AA201425). These ORFs encode polypeptides (see AA216754 *137949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, barholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.

This sequence is a primer for the human XIIS gene of the invention.

The XLIS fragments may be used to detect abnormalities in the expression of the XLIS gene transcripts or to compare their sequence with that of the XLIS transcripts from patients for in vitro especially prenatal diagnosis of lissencephaly (LIS) (or agyria-pachygyria), subcortical annuar heterotopia (SCLH), cortical dysgenesis, cryptogenic epilepsies or neurodegenerative diseases such as Alzaheimer's disease. These disorders mainly affect females as the XLIS gene is X-linked. The XLIS fragments may also be used to administer to patients to prevent or treat the above disorders and may be used to administer to patients to prevent or treat the above disorders and may be used as a tool in genetic counselling.

CIIS gene from a sample for comparison to normal samples in the in vitro diagnosis regime. This may also be performed by amplifying XLIS cDNA from the mRNA in the sample. Antibodies to XLIS may be used to detect XLIS in a biological sample. XLIS may also be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above neurological disorders. In addition XLIS may be used as a marker of neuronal cells at m early stage of development, its class as a marker of neuronal cells at m early stage of development is a leads to development of the fortical region of the brain and of the labore labore as a marker of the cortical region of the brain and of the

The sequences given in AAT42898-901 are single stranded (ss) circular oligonucleotides and their targets, which are used in the inhibition of the proliferation of myeloid leukaemia cells. These oligos are specifically targetted to a region in the bcr3/abl2 gene 385 conceptions by the bcr3/abl2 gene 385 circular oligonucleotides comprise a parallel binding (P) domain. The P and AP domains have sufficient complementarity to bind detectably to 1 strand of a defined nucleic card target. The P domain is capable of binding in a parallel manner to the target. The AP domain is capable of binding in an anti-parallel manner to the target and the ends of the P and AP domains are separated by the loop domains. The sc circular oligonucleotides can be used to regulate the synthesis of DNA, RNA or protein (pref. by DNA replication, DNA reverse transcription, RNA splicing, RNA polyadenylation, RNA cranslocation or protein (ranslocation) by binding a target sequence in the template. They can also be used to deliver a drug to a specific cell type by administering a drug covalently bound to them (i.e. to requiate the biosynthesis of DNA, RNA or protein in a targetted mammalian tumour cell in vivo, without substantially altering the blosynthesis of the DNA). They can also be used to detect a target on ucleic acid by detecting an oligonucleotide-target complex. The circular oligonucleotide can bind both single and double stranded to target nucleic acids, and has enhanced stability, compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Single stranded circular oligo:nucleotide comprising parallel and anti-parallel binding domain - used to regulate biosynthesis of DNA, RNA or protein in targetted mammalian tumour cell in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 12.6; DB 17; Length 34; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This primer was used to PCR amplify the promoter sequence from the 40S ribosomal protein S28 gene (AAZ30685) from Aspergillus oryzae. The invention relates to novel gene promoters (AAZ30680-Z30685) isolated from Aspergillus oryzae which can be used in genetic engineering to express heterologous proteins in Aspergillus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A new promoter derived from an Aspergillus genus microbe – useful for
producing exotic proteins

```
This DNA sequence is a region of a Brassica napus or Brassica oleracea genome which contains a polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Brassica species allele-specific oligonucleotide probes and primers - useful for plant breeding

APPLICANT: Monia, Brett P.
APPLICANT: Gaarde, William A.
TITLE OF INVENTION: Antisense Modulation of Focal Adhesion Kinase
TITLE OF INVENTION: Expression
FILE REFERENCE: ISPH-0389
CURRENT APPLICATION NUMBER: US/09/377,310B
CURRENT APPLICATION NUMBER: US/09/377,310B
CURRENT FILING DATE: 1999-08-19
NUMBER OF SEQ ID NOS: 43
SOFTWARE: PatentIn Ver. 2.0
SSQ ID NO 26
LENGTH: 15
TYPE: DNA
ORGANISM: Artificial Sequence
                                                                                                                                                                                                                                                            US-09-377-310-6

Sequence 12, Application US/08700186

Patent No. 5780266

GENERAL INFORMATION:
APPLICANT: Dillon, Patrick
APPLICANT: Vockley, Joseph
TITLE OF INVENTION: ARGINASE II
NUMBER OF SEQUENCES: 15
CORRESPONDENCE ADDRESS:
ADDRESSE: SmithKline Beecham Corporation
STREET: 709 Swedeland Road
CITY: King of Prussia
                                                                                                               GENERAL INFORMATION:
APPLICANT. CHANG, Lung-Ji
TITLE OF INVENTION: LENTIVIRAL VECTORS
NUMBER OF SEQUENCES: 20
CORRESPONDINCE ADDRESS:
ADDRESSEE: ADDRESSEE: ADDRESSEE: ADDRESSEE: ADDRESSEE: ADDRESSEE: ADDRESSEE: ADDRESSEE:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MOLECULE TYPE: other nucleic acid

DESCRIPTION: /desc = ""DNA""

US-08-935-312-15
                                                                          Sequence 15, Application US/08935312 Patent No. 6207455
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     REFERENCE/DOCKET NUMBER: CH
